NAVIGATING THE MARKETS

The *Portfolio Compass* provides a snapshot of LPL Research’s views on equity, equity sectors, fixed income, and alternative asset classes. This monthly publication illustrates our current views and will change as needed over a 3- to 12-month time horizon.

The top down is an important part of our asset allocation process. As a result, we have a macro section including our views of the global economy and key drivers of those views, and a section on what we are watching that might change those views.

CONTENTS

- Compass Changes1
- Macroeconomic Views.....2
- Asset Class & Sector Top Picks3
- Equity Asset Classes.....4
- Equity Sectors5
- Fixed Income.....6
- Commodities & Alternative Asset Classes ...8

All performance referenced herein is as of December 18, 2018, unless otherwise noted.

*As noted in our *2019 Outlook*, we expect an 8-10% S&P 500 Index total return in 2019, driven by 2.5–2.75% Gross Domestic Product (GDP) growth, 6–7% S&P 500 earnings growth, and a target price-to-earnings ratio (PE) of 17.5.

COMPASS CHANGES

- Downgraded small growth from neutral to negative/neutral.
- Downgraded small value from neutral/positive to neutral.
- Upgraded large growth from negative/neutral to neutral.
- Downgraded hedged foreign bonds from neutral to negative/neutral.

INVESTMENT TAKEAWAYS

- Expectations for solid corporate profits and steady economic growth support our forecast of 8–10% returns for the S&P 500 Index in 2019*.
- We expect a U.S. economic growth tailwind and attractive relative valuations compared with growth to help buoy value stocks.
- We expect a transition to market leadership from large cap stocks in 2019 as the economic cycle ages and trade issues ease.
- We favor EM equities over developed international for their solid economic growth trajectory, favorable demographics, attractive valuations, and prospects for a U.S.-China trade agreement.
- We emphasize a blend of high-quality intermediate bonds, with a preference for investment-grade corporates and mortgage-backed securities (MBS) over Treasuries and a small allocation to less interest-rate-sensitive sectors, such as bank loans or high-yield bonds, for suitable investors. That said, higher issuance, fewer investor protections temper bank loan optimism.
- Yield per unit of duration remains attractive for MBS.
- A Federal Reserve (Fed) rate hike in December is likely, potentially followed by two more in 2019. A moderate pickup in economic growth and inflation may be headwinds for fixed income.
- Technicals have weakened over the past month as the S&P 500 made new year-to-date lows and fell below its 200-day moving average. While year-end seasonality is a tailwind, we continue to look for signs of capitulation among investors.

BROAD ASSET CLASS VIEWS

LPL Research’s views on stocks, bonds, cash, and alternatives are illustrated below.

MACROECONOMIC VIEWS

	Economic Factor	Outlook	Investing Impact
ECONOMY	U.S. GDP Growth	We expect GDP of 2.5-2.75% in 2019.*	Absence of a recession would likely support equity markets.
	Consumer Spending	Fiscal stimulus, a strong labor market, and stock gains may help.	Supports consumer cyclicals, but potential growth in business spending may be more important.
	Business Spending	Tax reform and deregulation are supportive; watching trade policy.	Industrials would be most likely to benefit; upside for technology but some policy risks.
	Housing	Higher rates, labor shortages have become a headwind despite years of underbuilding.	Contracting sector may not offer opportunities until the next cycle.
	Import/Export	Service sector exports strong; uncertainty around trade.	May support technology and business services; some uncertainty for multinationals.
	Labor Market	Unemployment near multidecade low; wage gains supporting consumer spending.	May soon pressure profit margins; supports less accommodative Fed.
	Inflation	Still well contained despite modest wage, input cost pressure.	Interest rates likely to rise further, but only gradually.
	Business Cycle	Some late cycle signs but economy not overheating.	Equity markets may have room to run, but volatility may continue.
	Dollar	Trending higher but may not be sustainable.	Headwind for U.S. multinational earnings building.
	Global GDP Growth	Expected to hold near steady in 2019 despite recent slowing. Trade uncertainty remains a risk.	Potentially supportive of equities with risks for global multinationals.
POLICY	Fiscal	Tax reform and deregulation supporting growth.	May provide an economic lift, but government debt still a potential long-term headwind.
	Monetary	Gradual rate hike path likely to continue. Potential pause in 2019.	Fiscal tightening may impact growth. May be a modest headwind for quality bonds.
	Government	Fiscal stimulus likely outweighs tariff impact.	May contribute to higher stock volatility.
RISKS	Financial	Political environment may lead to looser credit standards and accelerate deregulation.	Short term positive; longer term may enable economic and market excesses to build.
	Geopolitical & Other	China, trade remain in focus.	May contribute to higher stock volatility.
OVERSEAS	Developed Overseas	Anti-Eurozone populism, Brexit uncertainty, slower growth are concerns.	Potential diversification benefits, but returns may lag U.S.
	Emerging Markets (EM)	Trade risk remains; there are pockets of stress, but EM growth outlook overall still looks good.	Low valuations and strong earnings offer EM upside potential once trade situation is resolved.
FINANCIAL CONDITIONS	Corporate Profits	We estimate 6-7% S&P 500 earnings growth in 2019.	S&P 500 may show appreciation consistent with earning gains.
	Main Street	Fed Beige Book supports positive outlook, although trade concerns increasing.	Supports cyclical sector performance.

The opinions voiced in this material are for general information only and are not intended to provide or be construed as providing specific investment advice or recommendations for your clients. Any economic forecasts set forth in the presentation may not develop as predicted and there can be no guarantee that strategies promoted will be successful.

*Our forecast for GDP growth of 2.5–2.75% is based on baseline potential GDP growth of 2.0%, using current trend growth and longer-term expected growth drivers, low probability of recession, and an upward adjustment due to the expected continued impact of fiscal stimulus. Economic growth is affected by changes to inputs such as business and consumer spending, housing, net exports, capital investments, and government spending.

ASSET CLASS & SECTOR TOP PICKS

Below we provide our top overall ideas across the various asset classes and sectors covered in this publication, as well as our best ideas within the three disciplines of our investment process: fundamentals, technicals, and valuations. More details on these and other investment ideas can be found on subsequent pages.

Characteristics	EQUITY ASSET CLASSES	EQUITY SECTORS	FIXED INCOME	Characteristics	ALTERNATIVE ASSET CLASSES
BEST OVERALL IDEAS	U.S. Stocks	Industrials Technology	Investment-Grade Corporates MBS	BEST OVERALL IDEAS	Long/Short Equity

Positive	Green square, Green circle	
Previous Position	Circle with arrow	

Global macro strategy is a hedge fund strategy that selects its holdings primarily on the macroeconomic and political views of various countries, and is subject to numerous risks such as: geopolitical, derivative, commodity, volatility, currency, and regulatory.

Long/short equity strategies are subject to normal alternative investment risks, including potentially higher fees; while there is additional management risk, as the manager is attempting to accurately anticipate the likely movement of both their long and short holdings. There is also the risk of "beta-mismatch," in which long positions could lose more than short positions during falling markets.

EQUITY ASSET CLASSES

Expectations for solid corporate profits and steady economic growth support our forecast of 8–10% returns for the S&P 500 Index in 2019, as noted in our *2019 Outlook* publication. We expect a U.S. economic growth tailwind and attractive relative valuations compared with growth to help buoy value stocks. We expect a transition to market leadership from large cap stocks in 2019 as the economic cycle ages, trade issues ease, and the dollar’s uptrend potentially hits resistance. Our positive EM view is based on a solid economic growth trajectory, favorable demographics, attractive valuations, and a potential U.S.-China trade agreement.

	Sector	F	T	V	⊖	○	⊕	Rationale
Style/Capitalization	Large Growth	■	■	■	●	●	●	As trade issues ease, the business cycle ages, and the dollar’s uptrend potentially hits resistance, large caps may sustain market leadership. We maintain our slight preference for value amid relatively attractive valuations after a sustained period of growth outperformance.
	Large Value	■	■	■	●	●	●	
	Mid Growth	■	■	■	●	●	●	Mid cap valuations are attractive relative to large caps, and merger and acquisition activity has picked up, which is supportive. As with large caps, relative valuations point to value over growth, although value performance has lagged in recent months.
	Mid Value	■	■	■	●	●	●	
	Small Growth	■	■	■	●	●	●	As the economic cycle ages in 2019, small caps may lag. Rising interest rates and potentially tighter financial conditions may create challenges for small cap companies with higher costs of capital and a greater reliance on debt.
	Small Value	■	■	■	●	●	●	
Region	U.S. Stocks	■	■	■	●	●	●	Among developed markets, we remain U.S. focused, supported by superior economic and profit growth and fiscal stimulus.
	Large Foreign	■	■	■	●	●	●	Growth in Europe has been slowing and may struggle to reach even 2% in 2019, while growth in Japan is also lagging, despite stimulus and corporate reform efforts. GDP growth in EM is likely to more than double the pace of developed international economies in 2019, and we believe political uncertainty is actually higher in Europe than in EM.
	Small Foreign	■	■	■	●	●	●	
	EM	■	■	■	●	●	●	Our positive EM view is based on a solid economic growth trajectory, favorable demographics, attractive valuations, and a potential U.S. trade agreement with China, with a bias toward emerging Asia.
MLPs	MLPs	■	■	■	●	●	●	Positives include rich yields, strong U.S. production, and acquisition activity. Recent tax policy clarity has buoyed performance. Positive bias.

Investing in master limited partnerships (MLPs) involves additional risks as compared with the risks of investing in common stock, including risks related to cash flow, dilution, and voting rights. MLPs may trade less frequently than larger companies due to their smaller capitalizations, which may result in erratic price movement or difficulty in buying or selling. MLPs are subject to significant regulation and may be adversely affected by changes in the regulatory environment, including the risk that an MLP could lose its tax status as a partnership. Additional management fees and other expenses are associated with investing in MLP funds.

EQUITY SECTORS

We continue to prefer cyclical sectors as the U.S. economic expansion continues, as noted in our *2019 Outlook* publication. We expect industrials to benefit from solid global demand, a pickup in capital spending, and a potential trade deal with China. Though financial stocks have struggled in recent months with the flat yield curve, we still believe the sector is well positioned to benefit from deregulation, higher dividend payouts, and a potentially more favorable interest rate environment, and valuations are attractive. After the communication services sector revamp, technology’s valuations are a bit lower, but the earnings growth outlook is also a bit weaker. Our communication services sector view is neutral.

	F	T	V	⊖	○	⊕	S&P*	Rationale
Cyclical	Materials	■	■	■	○	○	2.6	Strong earnings growth, potential infrastructure spending, and burgeoning inflation help, but slower China growth and trade tensions remain headwinds.
	Energy	■	■	■	○	○	5.5	Crude oil bear market creates a potentially more attractive entry point, though U.S. supply overhang remains, capping possible upside in our view.
	Industrials	■	■	■	○	○	9.1	We expect a U.S.-China trade deal in early 2019, which should bolster business confidence and help spur capital investment; slower growth overseas is a headwind.
	Communication Services	■	■	■	○	○	10.1	No longer a defensive sector after recent revamp. Our cautious view on media and traditional telecom, plus high valuations, offset strong growth outlook for former tech stocks.
	Consumer Discretionary	■	■	■	○	○	9.9	Solid earnings and tax cuts support a positive bias, but valuations are high and the sector tends to do relatively worse late in business cycles.
	Technology	■	■	■	○	○	20.2	Our positive business spending outlook, the sector’s productivity-enabling role, and steady earnings gains remain supportive.
	Financials	■	■	■	○	○	13.1	Valuations have become more attractive after a difficult 2018; deregulation, higher dividend payouts, and a potentially steeper yield curve may help in 2019.
Defensive	Utilities	■	■	■	○	○	3.4	Rising interest rates and our preference for cyclical sectors drive caution, though earnings growth has picked up some and interest rate increases will likely moderate.
	Healthcare	■	■	■	○	○	15.5	The healthcare spending outlook remains solid, demographics are positive, technicals look good, and policy uncertainty is clearing up; positive bias.
	Consumer Staples	■	■	■	○	○	7.6	We favor cyclical sectors, though market volatility helps the near-term outlook for defensive sectors; interest rate risk ebbing and technicals are positive.
	Real Estate	■	■	■	○	○	3.0	The group offers rich yields and fundamentals still look pretty good; still, we prefer more economically sensitive sectors.

* S&P 500 Weight (%)

Investing in real estate/REITs involves special risks such as potential illiquidity and may not be suitable for all investors. There is no assurance that the investment objectives of this program will be attained.

Because of its narrow focus, specialty sector investing, such as healthcare, financials, or energy, will be subject to greater volatility than investing more broadly across many sectors and companies.

There is no guarantee that a diversified portfolio will enhance overall returns or outperform a nondiversified portfolio. Diversification does not ensure against market risk.

FIXED INCOME

Maintaining a more cautious approach as we move later cycle, but still prefer corporate bonds to government bonds.

Interest rate sensitivity is less defensive but still lower than the benchmark due to expectations of gradually rising rates.

Yield spread is the difference between yields on differing debt instruments, calculated by deducting the yield of one instrument from another. The higher the yield spread, the greater the difference between the yields offered by each instrument. The spread can be measured between debt instruments of differing maturities, credit ratings, and risk.

Sector	F	T	V	⊖	○	⊕	Rationale
Munis–Short-Term	■	■	■	○	●	○	Valuations relative to Treasuries remain expensive relative to history.
Munis–Intermediate-Term	■	■	■	○	●	○	Valuations relative to Treasuries remain on the expensive side.
Munis–Long-Term	■	■	■	○	○	●	Long-term yields are more attractive than short-term yields, though higher duration may be a headwind if rates continue to rise. Valuations have become attractive relative to long-dated Treasuries.
Munis–High-Yield	■	■	■	●	○	○	Becoming more cautious as we move later cycle. Some long-term headwinds from pension obligations. Rate sensitivity may weigh if rates rise.

(Continued on next page)

For the purposes of this publication, intermediate-term bonds have maturities between 3 and 10 years, and short-term bonds are those with maturities of less than 3 years. All bonds are subject to market and interest rate risk if sold prior to maturity. Bond values will decline as interest rates rise and are subject to availability and change in price. High-yield/junk bonds are not investment-grade securities, involve substantial risks, and generally should be part of the diversified portfolio of sophisticated investors. Municipal bonds are subject to availability, price, and market and interest rate risk if sold prior to maturity. Bond values will decline as interest rates rise. Interest income may be subject to the alternative minimum tax. Federally tax-free but other state and local taxes may apply. Corporate bonds are considered higher risk than government bonds but normally offer a higher yield and are subject to market, interest rate, and credit risk, as well as additional risks based on the quality of issuer coupon rate, price, yield, maturity, and redemption features.

FIXED INCOME (CONTINUED)

For fixed income allocations, we continue to emphasize a blend of high-quality intermediate bonds in tactically oriented portfolios. We remain concerned about rising rates putting pressure on fixed income in 2019. Improving consumer demand and business investment could help corporate profits, but moderate inflationary pressure may offset these benefits for fixed income investors. We maintain a cautious approach with credit-sensitive areas of the market, but a “coupon-clipping” environment may still aid suitable investors.

Sector	F	T	V	⊖	○	⊕	Rationale
Taxable Bonds – U.S.	Treasuries	■	■	■	●		Yield spreads to overseas alternatives remain elevated but hedging costs lower attractiveness. Heavy supply, growth, and inflation normalization could be headwinds.
	TIPS	■	■	■		●	Breakeven inflation has moved below Fed's 2% target. Interest rate sensitivity could be a headwind.
	MBS	■	■	■		●	Yield per unit of duration remains attractive relative to other high-quality options, but Fed balance sheet normalization remains a risk over time.
	Investment-Grade Corporates	■	■	■		●	We still find incremental value in corporate bonds due to the economic backdrop. Valuations have improved on wider credit spreads.
	Preferred Stocks	■	■	■		●	Fundamentals are firm for U.S. banks. Higher interest rate sensitivity remains a risk.
	High-Yield Corporates	■	■	■		●	Average yield spread in mid-4% range near fair value for later cycle. Yields remain attractive. Economy supportive, but potential volatility becoming less attractive for fixed income investors.
	Bank Loans	■	■	■		●	Weaker investor protections, high issuance a concern. Still offers some protection against rising rates and economy remains supportive.
Taxable Bonds – Foreign	Foreign Bonds– Hedged	■	■	■	●	●	Fading easing bias of foreign central banks could lead to rising rates and pressure on performance.
	Foreign Bonds– Unhedged	■	■	■	●		Potential currency volatility, low yields, and unattractive valuations are negatives.
	EMD	■	■	■		●	Spreads have widened, making valuations more attractive. Trade policy remains a risk.

Investing in foreign and emerging market debt (EMD) securities involves special additional risks. These risks include, but are not limited to, currency risk, geopolitical and regulatory risk, and risk associated with varying settlement standards.

Mortgage-backed securities (MBS) are subject to credit, default, prepayment risk that acts much like call risk when you get your principal back sooner than the stated maturity, extension risk, the opposite of prepayment risk, market and interest rate risk.

Bank loans are loans issued by below investment-grade companies for short-term funding purposes with higher yield than short-term debt and involve risk.

Treasury Inflation-Protected Securities, or TIPS, are subject to market risk and significant interest rate risk as their longer duration makes them more sensitive to price declines associated with higher interest rates.

COMMODITIES & ALTERNATIVE ASSET CLASSES

The bear market in WTI Crude offers a potentially attractive entry point, although the U.S. supply overhang remains. Demand outlook remains generally positive for industrial metals, but trade tensions may persist and technicals are challenged. Tariffs are also weighing on crop prices, which have broken down technically. The event-driven investing outlook remains promising as tax reform and continued global growth may increase the corporate activity opportunity set.

	Sector	F	T	V	⊖	○	⊕	Rationale
Commodities	Industrial Metals	■	■		—●—			Global demand outlook remains generally positive and more U.S. infrastructure spending is still possible, but trade tensions may persist.
	Precious Metals	■	■		—●—			Market volatility has lifted gold prices but potential U.S. dollar strength, rising interest rates, low inflation expectations, and our preference for riskier assets suggest caution.
	Energy	■	■		—●—			The bear market in WTI Crude offers a potentially attractive entry point, although the U.S. supply overhang remains, capping possible upside in our view.
	Agricultural	■	■		—●—			Agriculture prices have broken down technically due to tariffs; trade tensions may persist.

	Sector	T	C	V	⊖	○	⊕	Rationale
Alternatives	Long/Short Equity	■	■	■	—●—			We continue to favor strategies with a conservative or variable net exposure to global markets. Recent equity market volatility has led some strategies to implement more of a defensive tilt, while also moving away from crowded industry holdings.
	Event Driven	■	■	■	—●—			Deal flow remains healthy; however, global mergers requiring regulatory approval from multiple countries face additional risk due to the ongoing global trade negotiations. The strategies' low-beta profile has provided investors strong downside protection the past month.
	Managed Futures	■	■	■	—●—			We continue to favor either multimanagers or a combination of uncorrelated trading strategies to smooth and diversify return profiles. Recent performance has been driven by short equity exposure across the globe, while fixed income exposure has turned positive during the past month.
	Global Macro	■	■	■	—●—			Global macro strategies continue to provide diverse exposure sets and have provided attractive downside protection during equity sell-offs. Shifts in fiscal policy, global political uncertainty, and economic divergences provide an attractive opportunity set.

	CHARACTERISTICS	ICON	DEFINITION
LEGEND	Catalysts	C T	Potential for favorable macroeconomic and/or idiosyncratic market developments that may benefit the investment strategy.
	Trading Environment	T E	Market characteristics present sufficient investment opportunities for this investment style.
	Volatility	V O	The current volatility regime provides a constructive environment that an investment of this style can capitalize on.

Alternative strategies may not be suitable for all investors and should be considered as an investment for the risk capital portion of the investor's portfolio. The strategies employed in the management of alternative investments may accelerate the velocity of potential losses.

Commodity-linked investments may be more volatile and less liquid than the underlying instruments or measures, and their value may be affected by the performance of the overall commodities baskets as well as weather, geopolitical events, and regulatory developments.

IMPORTANT DISCLOSURES

All performance referenced is historical and is no guarantee of future results.

There is no assurance that the techniques and strategies discussed are suitable for all investors or will yield positive outcomes. The purchase of certain securities may be required to effect some of the strategies.

All indexes are unmanaged and cannot be invested into directly. Unmanaged index returns do not reflect fees, expenses, or sales charges. Index performance is not indicative of the performance of any investment.

Stock and Pooled Investment Risks

The payment of dividends is not guaranteed. Companies may reduce or eliminate the payment of dividends at any given time.

Value investments can perform differently from the market as a whole. They can remain undervalued by the market for long periods of time.

Investing in stock includes numerous specific risks including: the fluctuation of dividend, loss of principal, and potential illiquidity of the investment in a falling market.

Investing in foreign and emerging markets securities involves special additional risks. These risks include, but are not limited to, currency risk, geopolitical risk, and risk associated with varying accounting standards. Investing in emerging markets may accentuate these risks.

The prices of small and mid cap stocks are generally more volatile than large cap stocks.

Bond and Debt Equity Risks

Government bonds and Treasury bills are guaranteed by the U.S. government as to the timely payment of principal and interest and, if held to maturity, offer a fixed rate of return and fixed principal value. However, the value of fund shares is not guaranteed and will fluctuate.

Alternative Risks

Event driven strategies, such as merger arbitrage, consist of buying shares of the target company in a proposed merger and fully or partially hedging the exposure to the acquirer by shorting the stock of the acquiring company or other means. This strategy involves significant risk as events may not occur as planned and disruptions to a planned merger may result in significant loss to a hedged position.

Managed futures strategies use systematic quantitative programs to find and invest in positive and negative trends in the futures markets for financials and commodities. Futures and forward trading is speculative, includes a high degree of risk that the anticipated market outcome may not occur, and may not be suitable for all investors.

INDEX DEFINITIONS

The S&P 500 Index is a capitalization-weighted index of 500 stocks designed to measure performance of the broad domestic economy through changes in the aggregate market value of 500 stocks representing all major industries.

The Bloomberg Barclays U.S. Municipal Bond Index covers the USD-denominated long-term tax-exempt bond market. The index has four main sectors: state and local general obligation bonds, revenue bonds, insured bonds, and prerefunded bonds.

The Russell 1000 Growth Index measures the performance of those Russell 1000 companies with higher price-to-book ratios and higher forecasted growth values. Russell 1000 Value Index measures the performance of those Russell 1000 companies with lower price-to-book ratios and lower forecasted growth values.

DEFINITIONS

A cyclical stock is an equity security whose price is affected by ups and downs in the overall economy. Cyclical stocks typically relate to companies that sell discretionary items that consumers can afford to buy more of in a booming economy and will cut back on during a recession.

Gross domestic product (GDP) is the monetary value of all the finished goods and services produced within a country's borders in a specific time period, though GDP is usually calculated on an annual basis. It includes all of private and public consumption, government outlays, investments and exports less imports that occur within a defined territory.

The simple moving average is an arithmetic moving average that is calculated by adding the closing price of the security for a number of time periods and then dividing this total by the number of time periods. Short-term averages respond quickly to changes in the price of the underlying, while long-term averages are slow to react.

The Beige Book is a commonly used name for the Federal Reserve's (Fed) report called the Summary of Commentary on Current Economic Conditions by Federal Reserve District. It is published just before the Federal Open Market Committee (FOMC) meeting on interest rates and is used to inform the members on changes in the economy since the last meeting.

Technical analysis is a methodology for evaluating securities based on statistics generated by market activity, such as past prices, volume and momentum, and is not intended to be used as the sole mechanism for trading decisions. Technical analysts do not attempt to measure a security's intrinsic value, but instead use charts and other tools to identify patterns and trends. Technical analysis carries inherent risk, chief amongst which is that past performance is not indicative of future results. Technical analysis should be used in conjunction with Fundamental analysis within the decision-making process and shall include but not be limited to the following considerations: investment thesis, suitability, expected time horizon, and operational factors, such as trading costs are examples.

The PE ratio (price-to-earnings ratio) is a measure of the price paid for a share relative to the annual net income or profit earned by the firm per share. It is a financial ratio used for valuation: a higher PE ratio means that investors are paying more for each unit of net income, so the stock is more expensive compared to one with lower PE ratio.

Alpha measures the difference between a portfolio's actual returns and its expected performance, given its level of risk as measured by Beta. A positive (negative) Alpha indicates the portfolio has performed better (worse) than its Beta would predict.

Beta measures a portfolio's volatility relative to its benchmark. A Beta greater than 1 suggests the portfolio has historically been more volatile than its benchmark. A Beta less than 1 suggests the portfolio has historically been less volatile than its benchmark.

Idiosyncratic risk can be thought of as the factors that affect an asset such as a stock and its underlying company at the microeconomic level. Idiosyncratic risk has little or no correlation with market risk, and can therefore be substantially mitigated or eliminated from a portfolio by using adequate diversification.
